

Improve.

Protect.

Comply.

***If your data is lost, will you be able to stay in business?
Relax... with etbackup-online.***

Research shows that tape backup fails to recover data as much as 50% of the time. Furthermore, in the event of a disaster, most companies do not have adequate offsite protection for their data.

etfile's *etbackup-online* solution eliminates unreliable tapes while providing critical offsite data storage for disaster recovery. Using online backup has a number of advantages compared to ordinary backup, but the main advantage is that you no longer have to worry about it, it's that simple.

Data is backed up automatically

With *etbackup-online* your data is backed up automatically everyday and is stored in our data center outside of your business, where it is protected against theft, fires, natural disasters, terrorist attacks and more. Your data will be encrypted and compressed every day and

sent via Internet to our maximum security, EMC® SAN Environment Data Center. It is secure and fast, based on state-of-the-art encryption and compression technology. In addition, your files and directories can be retrieved very quickly if necessary and because *etbackup-online* updates the backup history for you, you have the ability to retrieve data that was backed up yesterday, last week or one year ago, it's your choice.

etfile-On Demand

New to our back-up offer is *etfile-on demand*. This feature gives clients who use both etfile's online backup and document management solutions the ability to securely retrieve your etfile data via the internet, where you can view, add annotations, email and/or print documents from anywhere there is an internet connection.

etfile – Improve. Protect. Comply.

Online backup advantages

- **With *etbackup-online* you always have a backup, no matter what.** Your data is sent to our Data Center via the latest and most secure technology and stored in an encrypted form – you set your own encryption code.
- **More economical** – Online backup saves you the cost of tapes, backup software and the time it takes you to make and monitor the backup.
- **Your data is always available** – Your previous day's backup is always available, you can restore the backup to your computer whenever needed.

etbackup-online manager (ETM)

- **The ETM is built on a Java platform** – which makes it suitable for all operating systems such as: Windows, Mac OS X, Linux, Novell Netware and Sun Solaris.
- **The ETM has a simple user interface** – making it easy to use.
- **The ETM is very intelligent software** – it works from both your computer and the *etfile* servers, if there is a problem with the backup, the ETM will actively warn you about the problem via email.
- **The ETM uses a number of special backup modules** to make a successful backup of the following applications: Microsoft Exchange Server 2000/2003, Microsoft SQL Server 7.0/2000, Oracle 8i/9i, Lotus Domino/Notes 5.0 or later, MySQL 3.23.42 or later

The Data Center

Our Data Center stores all the central servers. *etfile* utilizes best-practices for backup, maintenance, and upgrades to ensure maximum performance and uptime.

Secure Facility

- N+1 Redundant Power – UPS and generator with alternative fuel source
- Biometric access limited to authorized personnel without exception
- Fire detection and suppression systems
- Continuous closed-circuit surveillance

Data Center Operations

- State-of-the-art EMC® SAN environment
- Redundant environmental systems
- 24x7 Network monitoring
- Powerful high throughput, low latency firewalls
- Unlimited bandwidth connections

How secure is online backup

- **Security is given top priority** – *etbackup-online* has its own firewalls and all data is sent via a secure 128 bit SSL connection.
- **Encryption** – All files that are sent to *etbackup-online* are 100% encrypted and are compressed before being sent. Only you know the encryption code, nobody apart from you can read the contents.
- **Replication Server** – Your data is stored on our central servers at our Data Center as well as on a replication server that is in another off-site, underground Data Center.
